Summary:

As December cold spreads its wings, frigid wind enthusiastically conducts Asia's winter once again all thanks to one Mr. Siberian High.

Detailed analysis:

The Siberian High is a massive cold-air anticyclone that forms over Siberia during winter. It drives cold outbreaks across the Indian subcontinent, influencing temperature, precipitation patterns, and even agricultural cycles. Understanding its formation, intensity, and movement helps aspirants answer questions on seasonal climate variations, monsoon depressions, and climate-change impacts on winter extremes.
